PREFACE TO THE FIRST EDITION,
1869.

For perfecting the statistical registration of diseases, with a view to the discovery of statistical truths concerning their history, nature, and phenomena, the want of a generally recognised Nomenclature of Diseases has long been felt as an indispensable condition.

The advantages accruing from accurate statistics of disease are likely to be the greater and the surer in proportion as the field of investigation is the wider.

The statistics of a single town may be instructive; but more instruction will be obtained from the compared statistics of various and many towns. This is alike true of different districts of the same country, and of different countries and climates: and the most instructive sanitary statistics would be those which related to the whole of the inhabited portions of the globe.

For the registration of such statistical facts it is clearly requisite that there should be a uniform Nomenclature of Diseases, co-extensive with the area of investigation; and taking the largest area, the universal globe, the Nomenclature would need to be one that can be understood and used by the educated people of all nations.

Among the great ends of such a uniform Nomenclature must be reckoned that of fixing definitely, for all places, the things about which medical observation is exercised, and of forming a steady basis upon which medical experience may be safely built.

Another main use of the statistical registration of diseases on a wide scale, is that it must tend to throw light upon the causes of disease, many of which causes, when duly recognised, may be capable of prevention, removal, or diminution.

When a general and uniform Nomenclature of Disease has once been carefully framed, when we are sure that medical observation is occupying itself everywhere with the selfsame diseases, the value of statistical tables becomes very high, as representing the course of events in disease under various circumstances of time, place, season, climate, manners and customs, age, sex, race, and treatment.

This general, or common, or *standard* nomenclature need not be imposed upon every nation and people as its proper nomenclature. It could not. It would be unintelligible by the people at large, and embarrassing to those by whom the necessary returns must be made. But the nomenclature proper or peculiar to each country, and which may be called its *national* nomenclature, should be readily convertible into the *standard* nomenclature.

The one, or the other, of these standard and national nomenclatures may first be framed by an English (or by any other) Committee, or the two may be framed simultaneously.

The Committee appointed by the Royal College of Physicians of London have prepared a Nomenclature suitable to England, and to all countries where the English language is in common use. For each name they have supplied the corresponding Latin term, which is the language of ancient science, and probably the fittest language for a nomen-

clature common to all the world; and also the equivalent term in the three modern languages which are the richest in medical learning and literature, the French, the German, and the Italian languages: and in this way they hope to have laid the foundation for a Nomenclature of Diseases in any language extant on the earth.

In the English list of names, it seemed desirable that as little deviation as possible should be made from those employed by the Registrar-General of England; otherwise his settled plans and his forms of returns, which have been followed for thirty years, would require to be remodelled; the comparison of future with past returns would be made difficult and perplexing, if not impossible; and a damaging break would be caused in evidence which becomes more and more trustworthy and valuable, in proportion as it is prolonged and continuous.

Again, it is desirable that all lists should consist, as much as may be possible, of short names—names comprised in one word, or in the fewest words; also, in the nomenclature proper, or national, that they should be names in common and popular use, especially when these are single, or short, and distinctive, and imply no erroneous or doubtful theories.

Names are not necessarily to be excluded, however, merely because they may seem to express only vague or imperfect knowledge; such names as Dropsy, Convulsions, Palsy—disorders which may severally depend upon various and different morbid changes within the body, not always easy of recognition. It has been well observed by Dr. Farr, whose aid has been of great value to the Committee, that the refusal to sanction such terms as these in the registration of diseases, 'would have an obvious

tendency to encourage reckless conjecture' in making returns.

Some names (as SMALL-POX) speak for themselves; many (as DIPHTHERIA) require to be defined, for the sole purpose, however, of identification: to others (as BRIGHT'S DISEASE) it is expedient, for the same purpose only, to append synonyms.

When fixed names have been given to diseases, their classification becomes a matter of some importance.

A good classification aids and simplifies the registration of diseases; helps towards a more easy comparison and knowledge of them, and towards the storing of experience respecting them; and facilitates the discovery of general principles from the collected, grouped, and compared phenomena.

But a good classification is a very difficult matter.

Diseases might be classified according to their symptoms; to their causes; to their intimate nature; to the tissues, or to the systems, of the body that are affected; or to the parts of the body as they lie anatomically.

After much consideration, the Committee have resolved 'that the proposed classification of diseases should be based upon anatomical considerations.'

In subservience to this anatomical distribution, diseases may also be grouped as being general or local.

General diseases are such as affect the whole frame rather than any special part of it. Local diseases are such as occupy special parts of the body.

General diseases may be conveniently subdivided into two sections, A and B.

Section A comprehends those disorders which appear to involve a morbid condition of the blood, and which

present for the most part, but not all of them, the following characters. They run a definite course, are attended with fever, and frequently with eruptions on the skin, are more or less readily communicable from person to person, and possess the singular and important property of generally protecting those who suffer them from a second attack. They are apt to occur epidemically. Of these epidemic visitations, Dr. FARR observes, that they distinguish one country from another, one year from another, have formed epochs in chronology, have decimated armies and disabled fleets, have influenced the fate of cities—nay, of empires.

Section B comprises, for the most part, disorders which are apt to invade different parts of the same body simultaneously or in succession. These are sometimes spoken of as constitutional diseases, and they often manifest a tendency to transmission by inheritance.

The construction of this Nomenclature has been so long in hand, that it may be proper and not uninteresting to record the circumstances of its origin and progress.

The idea which led to the formation of a general Nomenclature of Diseases originated in a correspondence between Dr. DUMBRECK, of the Medical Department of the Army, and Dr. SIBSON, respecting the need of such a Nomenclature for use in the Army Medical Service.

But at the *Comitia majora* of the Royal College of Physicians, held on the ninth day of July, 1857, it was resolved, on the motion of Dr. NAIRNE, in consequence of a letter addressed to the College by the Hospitals Committee of the Epidemiological Society, 'That a Committee be appointed to prepare a Nomenclature of Diseases, and

MEMORANDUM OF THE SUB-COMMITTEE ON CLASSIFICATION.

A.—As Relates to the Section Entitled in the First Edition "General Diseases."

1. As regards the question, What should be comprehended in a Nomenclature of Diseases? we are of opinion that it should include the names of all known diseases, and the names of all morbid processes and states component of diseases; that it should cover all known causes of disease; that it should, by means of its internal arrangement, indicate the relation of causes and effects in the production of disease.

2. As regards the classification of names, it has been already recognised that the uses subserved by a Nomenclature require more than a simple enumeration or catalogue of diseases. Some of the chief uses of a Nomenclature may be with convenience set for a moment in our view. The first line of the Preface to the first edition of the book under revision, declares the "perfecting the statistical registration of diseases" to be the object of the undertaking. This object has certainly not been as yet attained. No complete statistical registration of diseases has been attempted. Failing completeness, we have to note the existence of several important departments of registration having, individually, distinct objects. The Registrar-General's Department tabulates

deaths and causes of death; the Army and Navy Medical Departments tabulate diseases as well as deaths occurring in the two services; under the Local Government Board a certain regard is had to the prevalence of diseases in various parts of the kingdom. The inquiries conducted by these authorities have, in addition to their statistical value, a common etiological intent. The reports of the Registrars of Hospitals and of Medical Officers of Infirmaries, on the other hand, being more particularly constructed to further the study of disease, deal chiefly with the distribution of morbid processes within the body, and, in estimating the fatality of diseases, seek rather to find the proportion of deaths to attacks than the proportion of the number of attacks or deaths to the population.

The complexity of the arrangement by which the Nomenclature should be fitted to these several purposes grows at each step. Deaths are, in at least the final reports of the Registrar-General, recorded under one name only,—under the name of that disease which is the most obvious cause, whether ultimate or proximate. The registration of the Army and Navy Medical Departments in recording sickness as well as deaths calls for many more names. There are many diseases, skin-diseases for example, which are not likely to be returned as causes of death, and these must be provided for. In the ultimate returns of these departments, as in the Registrar-General's, each case comes under one name only, so that one kind of classification will meet the requirements of both registrations, and the only real difference is numerical. But the registration of hospitals and allied institutions takes note equally of ultimate and proximate causes of death, endeavours to state the complications of diseases, and seeks alike in fatal

and not-fatal sickness to show the distribution of morbid processes among the organs of the body. Instead of simple returns under one name for each individual, ill or dead, there is required a, commonly, multiple return for each disease or morbid process, as affecting several parts at once, or for each organ as the seat of more than one nameable process.

Keeping before us the necessary co-existence of those two dissimilar methods, we have endeavoured to make such arrangements as may serve each. But regarding the infinitely greater numerical importance and the public claims of the former, we have drawn our main lines of classification with a preponderant subordination to its objects.

The changes which we have to propose (i) in naming, and (ii) in classification, are as follows:—

(i). In naming.

A The general omission of definitions.

B The omission of most of the varieties of diseases.

C The omission of the terms.

Febricula	(12).
Equinia Mitis	(25).
Puerperal Fever	(32).
Puerperal Ephemera	(33).
Gonorrhœal Rheumatism	(35).
Synovial Rheumatism	(36)
Muscular Rheumatism	(37).
Chronic Rheumatism	(38).
Chronic Gout..	(40).
Gouty Synovitis	(41).
Lupus..	(46).
Rodent Ulcer..	(47).
Ergotism	(between 52 and 53)
General Dropsy	(57).

D The substitution of Epidemic Diarrhœa for Simple Cholera (17).
of Splenic Fever for Malignant Pustule (26).
of Osteo-arthritis for Chronic Osteo-arthritis (42).
of Malignant New Growth, Non-Malignant New Growth, and Cyst, for Cancer (44), Colloid (45), Non-Malignant Tumours and Cysts (p. 19, *et seq.*), Lupus, and Rodent Ulcer. The list of the New Growths and Cysts to be removed from its present position and to be placed for reference at the end of the book, with the list of parasites, of poisons, of injuries, etc.

The list of the processes of Syphilis and Tubercle, similarly, to be placed for reference at the end of the book.

E The addition of Epidemic Rose-rash (Rötheln) (5),
of Typho-malarial fever (17),
of Malarial cachexia (23),
of Myxœdema (68),
of Parangi (71),
of Leucocythæmia (76),
of Hæmophilia (77),
of Idiopathic anæmia (75),
of Glycosuria (79),
of the effects of certain external and internal causes of disease.

For the collection of names thus altered we have next to propose a new title. The term "General Diseases" fails to express the nature of the group which it heads. It is used apparently in the signification "not local." The Latin translation, "Morbi corporis universi," certainly conveys more clearly the idea intended. But even this term does not include all the species of the original or of the proposed group. We have, therefore, used a re-translation of the Latin, with an additional phrase to cover the cases not included by the term "morbi corporis universi." Our proposed version is "Diseases of the

Whole Body, and Diseases which may be distributed in several parts at one time (General Diseases)."

(ii). In classification.

Bearing in mind the needs of the Registrar-General, and the suggestions of the United States National Board of Health, we have drawn up a classification of this part of the Nomenclature on the basis of etiology. In the first place we have established four Groups, viz. :—

A Diseases dependent on Morbid Poisons. (Specific Febrile Diseases.)

B Diseases dependent on External agents other than Morbid Poisons.

C Developmental Diseases.

D Not classified, or Miscellaneous Diseases.

Within these groups we have, by further division into sub-groups, indicated several closer alliances of causal relation.

Group A contains five sub-groups. The first and most typical comprehends the Exanthemata, with other specific febrile diseases closely resembling them; the second, malarial fevers; the third, septic diseases; the fourth, venereal diseases; the fifth, febrile diseases communicable from animals to man.

Group B contains four sub-groups of diseases produced by parasites, poisons, injuries, and errors of diet respectively.

Group C is not sub-divided.

In Group D lines are used to indicate alliances or isolation.

No names are proposed for the sub-groups.

The collection of groups thus formed and constituted does not include many morbid states or processes which are often found existing in several parts of the body at one time. We may cite Inflammation as such a one. Under the system by which one nominal return records each death, a case in which several parts have been affected by inflammation,—by way of example, lung, pleura, and pericardium,—will, if it prove fatal, appear as a case of inflammation of only one of those parts—will appear as pneumonia, or pleuro-pneumonia, or pleuritis, or pericarditis, according to the apparently predominant share taken by any of the inflammations in causing the death. If "inflammation" were added to the list of what we may call for brevity's sake "general diseases," and the return were to be made under that head, the information conveyed would still be imperfect, and vagueness in returns would be fostered. But in Hospital reports it is most desirable that the exact distribution of multiple inflammations should be recorded. We have, therefore, prepared an additional table of "Morbid States and Processes, as such." This table is a modification of the list to be found at pages 29 and 31 of the first edition, placed there as a guide to the order of return under the several sections of Local Diseases. In some of its items, as, for instance, in "Parasitic Invasion," it overlaps the Section of "General Diseases." We have been content to allow such overlapping, seeing that the list will still remain as a guide to the internal arrangement of the Sections of "Local Diseases," and will, in this sense, be an independent

Section. Again, we have made this table precedent and introductory to the Section of "General Diseases" on the ground that its constituents are in various associations the elements of all the diseases subsequently tabulated. It contains, so to speak, the alphabet out of which the diseases are spelled. We trust that its introduction here may be justified on the principle that the enumerations of this book should be as entire and complete as possible, and on the representation that for the purposes of Hospital registration the Section "General Diseases" and the Section "Local Diseases" are insufficient, and that this table will supply the deficiency. The table is intended to form, in complementary conjunction with the other sections, the basis of a cross tabulation, in which the horizontal lines of this alphabet may cut the vertical lines of an anatomical alphabet. By this means it will be possible in returns of Diseases to delineate completely their comparative distribution within the body.

B.—As Relates to Local Diseases.

As regards the general arrangement of Local Diseases, but few—as few as possible—changes have been made. The Diseases of the Lymphatic System, previously scattered through several sections, have been gathered into one, to which a note of anatomical distribution is subjoined. The Diseases of the Spleen, Thymus, Thyroid Body, and Supra-renal Capsules have been brought into nearness with the Diseases of the Lymphatic System, and the whole group has been placed next in order to the

Diseases of the Digestive System. The Diseases of the Male Urethra have been transferred, with Diseases of the Prostate, to Diseases of the Male Generative Organs. The Section of Affections Connected with Pregnancy has been omitted. As regards the internal arrangement of the several sections of Local Diseases, it may be first stated that the names are placed in each section according to the order set forth in the enumeration at page 3. Next, that while the Sub-Committee fully admit the wisdom of the remark at page vii of the Preface to the First Edition, to the effect that—"Names are not necessarily to be excluded merely because they may seem to express only vague or imperfect knowledge," they have felt it right to indicate, as strongly as possible, the necessity of avoiding the use of the names of symptoms, wherever the names of diseases or of causes of symptoms can with reasonable certainty be substituted. In framing the Section of Diseases of the Nervous System, they have gone so far as to make two sub-sections: the first for cases in which the actual morbid process is determined; the second for single symptoms, or for several symptoms grouped under one name, the cause not being accurately determined. Taking, for example, the first name in the Second Section, they would indicate that the name Apoplexy should be used only when the morbid condition cannot be recognised; that wherever one of its several possible causes, such as cerebral hæmorrhage, can be recognised or demonstrated, the return should be made under such cause. No other section has been thus distinctly sub-divided, but in the order of names, the separation between definitely recognised states or causes, on the one hand, and symptoms on the other, is every-

where indicated; symptoms being placed after morbid processes.

Index.

The Index, which is in some senses the real Nomenclature, includes every name, and, of compound names, every part. Many names now expunged from the List of Diseases are retained in italics; and several names still to some extent in use, but not included in the general list, are also inserted in italics, with references, in each case, directing the return of the conditions covered by the disused or not recognised name under the now recognised name.

LATIN SYNONYMS.

Dr. Henry Thompson (whose extreme care and accuracy had been conspicuously shown in the former edition) was invited again to superintend the Latin Synonyms, and upon his declining to undertake the task a second time, it was put into the hands of Dr. Greenhill.

MEMORANDUM OF THE REVISER OF THE LATIN SYNONYMS.

With respect to the Latin Synonyms, as one of the main reasons for introducing them was to render the Nomenclature more accessible to foreigners, it was thought better to endeavour to make them as useful as possible, by employing the terms that are commonly accepted as constituting the current medical language of the present day. By adopting this method, a very heterogeneous collection of words has been put together; one set being genuine Greek or Latin terms, of which some still retain their original meaning, while others are used in a sense altogether different; another set of words has been introduced in a more or less Latinized form from other languages; a third has been legitimately formed chiefly on the Greek model, to represent diseases that were unknown in ancient times; and a fourth has been barbarously formed with the same object, and has now obtained such a degree of popularity that it would be practically impossible to expel them from the medical vocabulary. But, notwithstanding the medley of words

thus introduced, which must necessarily be offensive to scholars, it was believed that the utility of this Nomenclature would be seriously lessened if any other method should be adopted. At the same time it is hoped that the careful reader will be able to notice, that, when two or more words, or forms of the same word, presented themselves for adoption, every care has been taken to select that which seemed most in accordance with classical usage. An occasional want of uniformity in words and forms of expression will be noticed, which, however, is believed to be of no real importance, and which, in a work of this kind, is almost unavoidable.

EXPLANATIONS.

The following Explanations are offered for the guidance of persons using the Nomenclature for purposes of registration of diseases:—

The name of the disease to be registered should first be sought in the Alphabetical Index at the end of the book. It will be observed that the names in the Index are printed, for the most part, in Egyptian type, a smaller number being printed in *Italics*. The Egyptian type denotes names which are recognised in this Nomenclature; the *Italics* names which are not recognised. To the names in *Italics* are added references showing under what recognised names the disease supposed to be indicated should be returned. The numbers not included in brackets show the page on which the name under which the return should be made is to be found. The numbers included in brackets show other pages on which the name is recorded, for purpose of cross-reference, but not for ordinary return.

In referring from the Index to the body of the book it will be observed that the name of every disease is preceded by a number, and that some names are printed in Roman type, others in *Italics*. The names printed in Roman type are to be returned just as they stand; the names printed in *Italics* are not to be returned as they stand. To each of them is prefixed a number included in brackets marking the position of the proper return. The names in *Italics* indicate, for the most part, local manifestations of general diseases, and the references are intended to ensure the return of such local manifestations under their common casual name—to aid, in fact, the primary classification of registered names of diseases.*

It will be obvious that the names in *Italics* are placed in the several sections of local diseases in order to effect completeness of classification, and ultimately to help reference.

---

* For example, in the list of diseases of the Stomach, on page 103, Malignant New Growth of that organ is included, but is printed in *Italics*. In making return, it should be placed among other Malignant New Growths, to which the prefixed number (63) in brackets refers it.

Where varieties are observable in the forms of disease such varieties are indicated by their being "indented"—*i.e.*, printed below and somewhat to the right of the principal heading, each being preceded by a distinguishing letter. Such lists are given by way of example, and are not to be regarded as exhaustive.

Diseases should only be returned under such general names as "Dropsy," "Convulsions," "Palsy," when the morbid conditions upon which they depend are unknown, but when the cause has been ascertained, the case should be registered under the head of the primary disease, the secondary affections being also specified.

New Growths are to be returned under Nos. 62 and 63 among "General Diseases." For the sub-division of New Growths the table at page 307 is to be consulted, and the return should always include the particular New Growth and its anatomical position.

Cysts are returned among "Local Diseases."

Surgical Operations, Parasites, Malformations, the list of Cysts and New Growths (Tumours), and the processes of Syphilis and Tubercle are placed in an Appendix.

Notes in explanation of particular cases are given in various parts of the work.

Arrangement of Local Diseases.

The attention of persons making use of this Nomenclature is especially called to the "Enumeration" on page 3. That list includes nearly all the important morbid states and processes which affect the various organs, and is, therefore, a key to the general arrangement of such states and processes which is adopted throughout the book.

LOCAL DISEASES.

DISEASES OF THE NERVOUS SYSTEM.

The diseases printed in *Italics* under this heading are inserted for the sake of local classification only, and are not to be registered here, but at the place referred to in each instance by number.

It has been found necessary to divide this section into three sub-sections. The first contains the names of morbid states and processes affecting the several parts of the nervous system; the second, the names of symptoms and groups of symptoms related with such pathological conditions or with other conditions not accurately known; the third, the names of mental diseases.

Cases should be returned according to the first sub-section when the pathological conditions shall have been verified by post-mortem examination, or may be inferred with certainty from the symptoms. But cases wanting such verification should be returned according to the second and third sub-sections.

Sub-section 1.

The names refer, unless it be otherwise indicated, to affections of the Brain and Spinal Cord, their membranes, and the nerves; and, in returns, the parts affected should be specified.

LOCAL INJURIES.

General Note.—In all cases of injury specify, first, whether accidental, judicial, homicidal, self-inflicted, or in battle; second, by what mechanism or agent inflicted.

In the list of local injuries an arrangement, somewhat similar to that of local diseases, has been adopted. The various kinds of injuries which may befall tissues and parts are first enumerated; secondly, the injuries which are known to affect certain generally distributed systems and tissues of the body are named; thirdly, the injuries affecting the several anatomical regions of the body are named. No returns should be made under the first list, which is simply for guidance in return under the other two; in the second list the return will be made according to the nature of the injury, and the part affected, according to an order indicated in each section; in the third list the injuries and parts are enumerated together.

Enumeration of Local Injuries, as such, independent of the Part affected.*

CLASSIFICATION OF TUMOURS,

COMPREHENDING MALIGNANT NEW GROWTHS, NON-MALIGNANT NEW GROWTHS, AND CYSTS.

In deference to the needs of the various registration authorities, a distinction has been made in the general and local tables between Malignant and Non-malignant New Growths. The Tumours are, however, here classified according to their mode of origin and their structure. Such a classification involves in certain cases the association under one head of Malignant and Non-malignant Growths, as, for instance, under Sarcoma. To facilitate returns under the general tables, the Malignant Growths are here marked by two asterisks; the names which include both kinds of growth, by one. The classification of Tumours, to be complete, must include Cysts as well as New Growths. The Cysts are accordingly introduced here, but in italics, and should be returned severally among the local affections of organs.
